

PREVIEW_ Dave Feldman - Presentation (Breckenridge 2018) 1

Dave Feldman: The president is like, "This is fantastic. Let me see if I got this straight. "Food that's coming from outside the country/party that is coming into the intestine. Well then that actually is going to be loaded onto the brown ships and distributed and then all of the stuff that's in the food banks that spills off from trying to deliver it to different houses, that's actually also going to make its way to the liver and those purple boat are then going to counterbalance the amount that's coming from the brown boats."

And yes, the engineer says, "That's exactly right. "In fact when there is more that's coming in from the outside, then that means that there will be less that needs to get pulled from the food banks and ultimately delivered via the liver."

Likewise it counterbalances in the other direction if we have a shortage of food that's coming from the outside we can counterbalance that with the purple boats. And surprise, I've been talking about lipids this whole time.

This is why I don't have a shining future as a magician. Yes the houses were cells, the fatty acids were the boxes and of course if you've got three of those boxes, you've got triglycerides. That of course was energy being distributed everywhere, but the main thing I want you to focus on, the reason I really wanted to drive this home is all the way up to this point my story's been about only one thing, distributing food, which was actually just fat based energy.
